A Benchmark for Interpretability Methods in DNNs (Google Brain)

Sam Laing

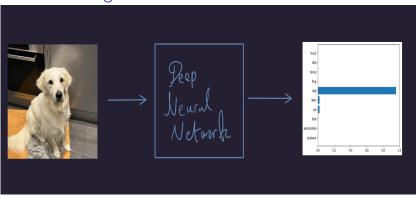

University of Tuebingen

June 26, 2024

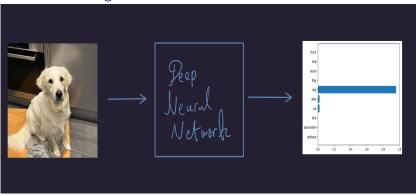

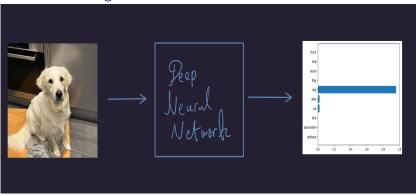

• Deep image classification: "features" = pixels .

- Deep image classification: "features" = pixels .
- \bullet Interpretability methods \rightarrow help engineer understand their model

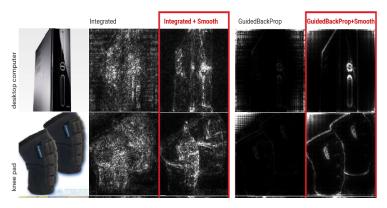

- Deep image classification: "features" = pixels .
- ullet Interpretability methods o help engineer understand their model
- Ostensibly. But are they really doing anything?
- Interpretability method A > Interpretability method B??

- Deep image classification: "features" = pixels.
- ullet Interpretability methods o help engineer understand their model
- Ostensibly. But are they really doing anything?
- Interpretability method A > Interpretability method B??
- If only there was a benchmarking framework to do this...

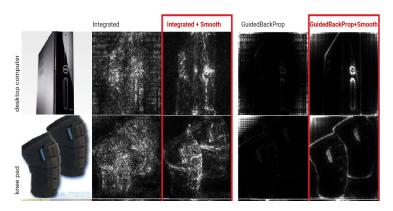

Included Interpretability Methods

ullet Gradients (sensitivity heatmaps) $e=\partial_{x_i}f_c(x)$

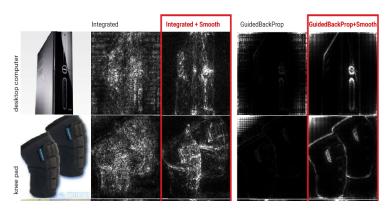

Sam Laing (University of Tuebingen) A Benchmark for Interpretability Method

Included Interpretability Methods

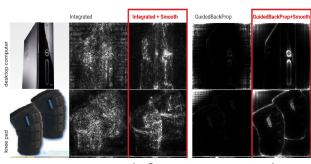

- ullet Gradients (sensitivity heatmaps) $e=\partial_{x_i}f_c(x)$
- Guided Backprop (sort of a tidied up sensitivity map). Keep positives in ReLU

Included Interpretability Methods

- ullet Gradients (sensitivity heatmaps) $e=\partial_{x_i}f_c(x)$
- Guided Backprop (sort of a tidied up sensitivity map). Keep positives in ReLU
- Integrated Gradients

Smilkov's "Smoothgrad" paper (2017):

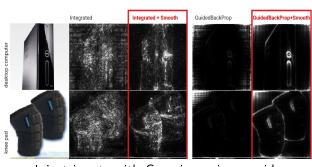

"Reduce noise by adding noise"

• Inject inputs with Gaussian noise consider mean/variance of outputs

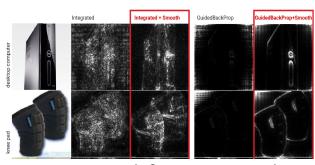

Smilkov's "Smoothgrad" paper (2017):

- Inject inputs with Gaussian noise consider mean/variance of outputs
- $\eta_i \sim N(0, \sigma^2 I) \ i \in \{1, \dots, J\}$

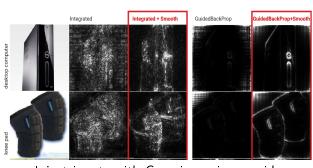

Smilkov's "Smoothgrad" paper (2017):

- Inject inputs with Gaussian noise consider mean/variance of outputs
- $\eta_i \sim N(0, \sigma^2 I) \ i \in \{1, \dots, J\}$
- Smooth Grad (SG) $e = \sum_{i=1}^{J} f_c(x + \eta_i)$

Smilkov's "Smoothgrad" paper (2017):

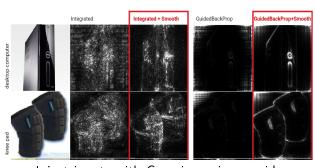

- Inject inputs with Gaussian noise consider mean/variance of outputs
- $\eta_i \sim N(0, \sigma^2 I) \ i \in \{1, \dots, J\}$
- Smooth Grad (SG) $e = \sum_{i=1}^{J} f_c(x + \eta_i)$
- VarGrad (VAR) $e = Var(\{f_c(x + \eta_i)\}_{i=1}^J)$

Smilkov's "Smoothgrad" paper (2017):

- Inject inputs with Gaussian noise consider mean/variance of outputs
- $\eta_i \sim N(0, \sigma^2 I) \ i \in \{1, ..., J\}$
- Smooth Grad (SG) $e = \sum_{i=1}^{J} f_c(x + \eta_i)$
- VarGrad (VAR) $e = Var(\{f_c(x + \eta_i)\}_{i=1}^J)$
- SmoothGrad Squared (SG-SQ) $e = \sum_{i=1}^{J} f_c(x + \eta_i)^2$

Smilkov's "Smoothgrad" paper (2017):

- Inject inputs with Gaussian noise consider mean/variance of outputs
- $\eta_i \sim N(0, \sigma^2 I) \ i \in \{1, ..., J\}$
- Smooth Grad (SG) $e = \sum_{i=1}^{J} f_c(x + \eta_i)$
- VarGrad (VAR) $e = Var(\{f_c(x + \eta_i)\}_{i=1}^J)$
- SmoothGrad Squared (SG-SQ) $e = \sum_{i=1}^{J} f_c(x + \eta_i)^2$
- →Apply attribution/interpretability methods to these statistics

ROAR (RemOve And Retrain)

The Idea Behind ROAR

Start with trained classifier f

The Idea Behind ROAR

Start with trained classifier f \forall method, \forall image \in dataset, sort pixels by ranked importance.

The Idea Behind ROAR

Start with trained classifier f \forall method, \forall image \in dataset, sort pixels by ranked importance. So $(e_i)_{i=1}^D$ of pixel coordinates \forall image in dataset. $\Longrightarrow ((e_i^{(n)})_{i=1}^D)_{n=1}^N$

for $j \in \{0, 10, \dots, 100\}$, replace the top j% ranked pixels with the per channel mean \forall image and retrain.

Proportion: 10%

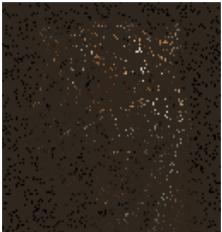

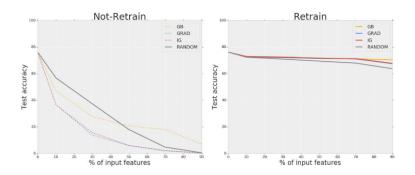

- Effect of having dropped the "most informative pixels" as determined by each interpretability method.
- Investigate how much their removal from the training process effects accuracy.
- Also a no-retraining variant

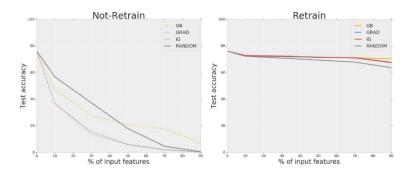

• No retraining $\implies p_{\text{train}} \neq p_{\text{test}} \dots \rightarrow \leftarrow \text{in ML}$

- No retraining $\implies p_{\text{train}} \neq p_{\text{test}} \dots \rightarrow \leftarrow \text{in ML}$
- Paper therefore argues it is necessary

- No retraining $\implies p_{\text{train}} \neq p_{\text{test}} \dots \rightarrow \leftarrow \text{in ML}$
- Paper therefore argues it is necessary

- No retraining $\implies p_{\text{train}} \neq p_{\text{test}} \dots \rightarrow \leftarrow \text{in ML}$
- Paper therefore argues it is necessary

• Paper does some validation with synthetic data but unconvincing.

Really just a refinement of above.

ResNet50 classifier: Imagenet, Birdsnap and Food 101

Really just a refinement of above.

- ResNet50 classifier: Imagenet, Birdsnap and Food 101
- Random pixel selection and Sobel Edge filter benchmarks.

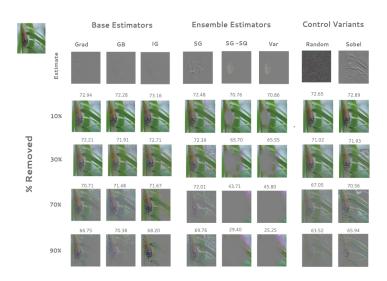

Really just a refinement of above.

- ResNet50 classifier: Imagenet, Birdsnap and Food 101
- Random pixel selection and Sobel Edge filter benchmarks.
- New train and test sets $\forall j \in \{0, 10, 30, 50, 70, 90\}$

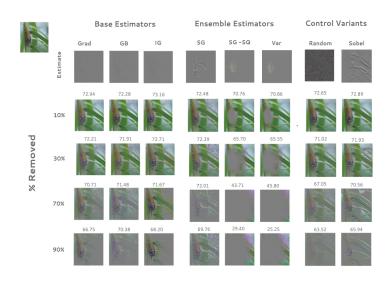

Really just a refinement of above.

- ResNet50 classifier: Imagenet, Birdsnap and Food 101
- Random pixel selection and Sobel Edge filter benchmarks.
- New train and test sets $\forall j \in \{0, 10, 30, 50, 70, 90\}$
- ullet Each model retrained 5 times \forall method (DNN training is noisy)

ROAR in Action

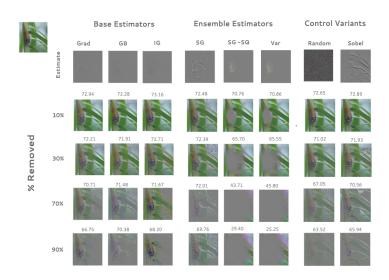

ROAR in Action

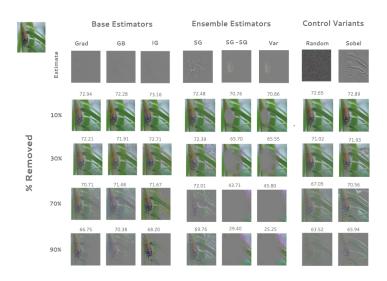

Initial Imagenet accuracy: \sim 78 % ...

ROAR in Action

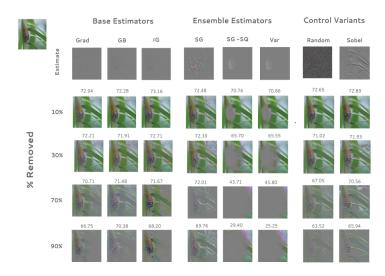

Initial Imagenet accuracy: \sim 78 % ... Paper is from 2018!

ROAR in Action

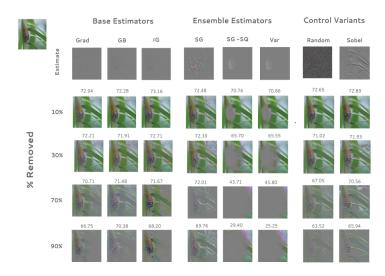

On average Replacing many pixels big decrease of predictive power!

Results

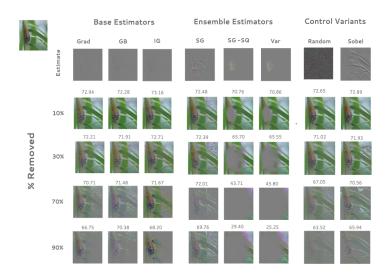

ImageNet, 90% pixels randomly removed... still 63.52% accuracy relative to the original 78.68%

Results

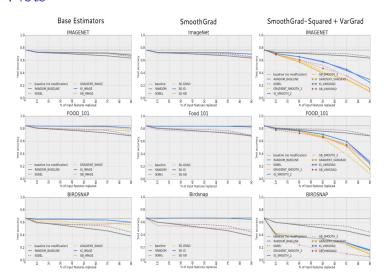

ImageNet, 90% pixels randomly removed... still 63.52% accuracy relative to the original 78.68%

Results

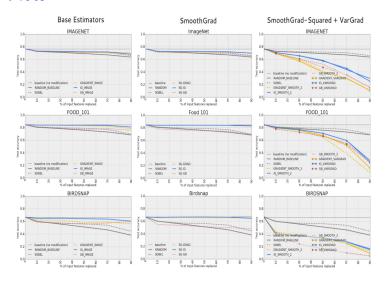

According to the paper, SG-SQ and VarGrad are the real heros

Plots

SG - SQ and VarGrad always outperformed...

Plots

SG - SQ and VarGrad always outperformed... But best method to wrap around changed

Why VAR and SG-SQ over Vanilla SG?

- Why VAR and SG-SQ over Vanilla SG?
- Variance captures more of the distribution's properties than mean?

- Why VAR and SG-SQ over Vanilla SG?
- Variance captures more of the distribution's properties than mean?
- SG-SQ something of a middleground as unnormalized

- Why VAR and SG-SQ over Vanilla SG?
- Variance captures more of the distribution's properties than mean?
- SG-SQ something of a middleground as unnormalized

SG-SQ:
$$e_2 := \sum_{i=1}^{J} f_{c_i}(x + \eta_i)^2$$
, SG: $e := \sum_{i=1}^{J} f_{c_i}(x + \eta_i)$
 $\implies \partial_{x_d} e_2 = 2e \cdot \partial_{x_d} e \quad \forall d$

Gradient of e_2 might encode more info since mean explicitely there

Another possible Issue

- Cost!
- More compute needed for big datasets

Another possible Issue

- Cost!
- More compute needed for big datasets
- Retraining a large image classifier many times may be unfeasible

Another possible Issue

- Cost!
- More compute needed for big datasets
- Retraining a large image classifier many times may be unfeasible
- Best depends on dataset
- Without retraining, you run into theoretical violations of ML!

So many interpretability methods boast high performance: How to pick the right one?

Hard to find strong quantitative statements about explainability accuracy.

So many interpretability methods boast high performance: How to pick the right one?

Hard to find strong quantitative statements about explainability accuracy.

Did I like it?

So many interpretability methods boast high performance: How to pick the right one?

Hard to find strong quantitative statements about explainability accuracy.

Did I like it?

Yes and No!

So many interpretability methods boast high performance: How to pick the right one?

Hard to find strong quantitative statements about explainability accuracy.

Did I like it?

Yes and No!

Quantitative framework and discovery are nice.

So many interpretability methods boast high performance: How to pick the right one?

Hard to find strong quantitative statements about explainability accuracy.

Did I like it?

Yes and No!

Quantitative framework and discovery are nice.

Some of the details might need refinement

So many interpretability methods boast high performance: How to pick the right one?

Hard to find strong quantitative statements about explainability accuracy.

Did I like it?

Yes and No!

Quantitative framework and discovery are nice.

Some of the details might need refinement

Slightly limited number of techniques compared

Paper used unclear notation and ommitted details at times
